The *City of Key West*, Florida is aggressively working toward eliminating non-point source pollution by infiltrating stormwater runoff under the Island via gravity injection wells. A 24" pvc pipe will convey the stormwater 100 feet underground where it will quickly disperse. The Nutrient Separating Baffle Boxes will pre-filter the stormwater before it enters the injection well, which is critical to maintaining the designed flow rates of the injection wells. The project is being overseen by *Perez Engineering* and is moving smoothly ahead at the rate of 2 injection wells per week.

Injection Wells And Nutrient Separating Baffle Boxes Stop Pollution In Key West

Schematic of Key West Structures

The anticipated environmental results include reducing potential health risks to beach bathers by eliminating or reducing storm water discharges to near shore waters which may carry bacterial contamination. The project is also expected to aid in the protection of the aquatic resources in the near shore waters by eliminating or reducing storm water discharges that contain nutrients, metals, hydro-carbons, and other storm water pollutants. In other words... ***Save The Coral Reefs!***
