## **Floc-Doser™** Polymer Dosing Tray

For use during construction and post construction, and will hold a standard size polyacrylamide applicator log (Floc Log).

### **An Integral Part Of The Treatment Train**

The **Floc-Doser** can be an integral part of your NPDES water shed management plan. As a water treatment device just under the grate at each inlet, the water flow is dosed at a maximum time and distance away from the next point of treatment which may be a pond or **Nutrient Separating Baffle Box**.

### **Floc Logs Will Last Longer And Save Money!**

The Floc Log within the Doser only has to deal with water flow from that specific inlet which will make the log last longer and save money. The UV cover over top the Floc Log helps prevent degradation of the log and ensures proper dosing.

#### **Installation**

**Step 1:** Remove the grate and place **Floc-Doser** in the catchbasin. The **Floc-Doser** is sized and ordered to fit.

**Step 2:** Press the Floc Log onto the spikes that will hold the log in place. The rope can either be cut off or wrapped around the log. For larger inlets multiple logs will likely be used.

**Step 3:** Slide the UV cover in place. Slots in the cover slide along holding pins until it locks in place. Then replace the grate.
